To Whom It May Concern:

Exemption Application for Lead in Electronic Ceramic Parts (e.g. Piezoelectronic Devices)

We are manufacturers of ceramic PTC (positive temperatures coefficient) pills. The ceramic PTC pills have high concentration of lead and its compounds, according to the test method with reference to "IEC 62321 Ed.1 111/54/CDV".

We hereby to apply for continuous exemption in RoHS directive (Article 5, (1)c) for "lead in electronic ceramic parts (e.g. piezoelectronic devices)", because:

Currently, to the best our knowledge, there is no alternative material for Pb (Lead) to produce the ceramic PTC pills with similar performance. There are some trials in the industry using material without lead to produce ceramic PTC pills, such as modification or power preparation methods. But these methods are still in laboratory stage and it is said that the performance is much worse than the current ones.

Sincerely yours,

Stamp and Signature
